

SIC PIZZA

POS + Restaurant OS

One live table.
Everyone sees
what they need.

A connected restaurant workflow for servers,
guests, kitchen teams, and managers.

Explore pos.yorkstead.com

Interactive platform demonstration
Featuring the fictional SIC Pizza Co. restaurant

BUILT AROUND SERVICE

From the first request to the final
check.

See the room. Know where to go.

The floor view brings table stage, diners, open requests, kitchen activity, and balance into one place.

A table is a live session

Orders, people, requests, and payment state stay attached to the table throughout service.

Focus the floor

Move between all tables, tables needing attention, and your own section. Filter by dining area.

Follow the service journey

Seated → ordering → entrees → check → paying. The current stage gives the team shared context.

YORKSTEAD SYSTEMS

SIC Pizza demonstration | Sample restaurant data

02 / 09

Keep every item connected to its diner.

A detailed table workspace joins ordering, guest proposals, kitchen status, service tasks, and the split bill.

Order with context

Configured items show modifiers, course, station, and diner ownership. Shared items remain visible as shared.

Guests can participate

The guest web experience supports joining a table and proposing items. Staff approval keeps submissions under server control.

Service stays in view

Guest requests and course pacing sit alongside the order, so the next action is visible without losing table context.

Guest join screen
Illustrative table QR from the supplied screenshot.

Turn requests into visible next actions.

A shared attention queue tracks service work; Do This Next highlights rules-based operational priorities.

Review Proposals

Make the next move clear

Suggestions turn current table conditions into focused actions. The recommendation engine uses rules, not an AI model.

Keep production aligned with the table.

The kitchen display separates work by station while keeping each item connected to its table and course.

Route by station

Pizza, bar, prep, and other configured stations see the work relevant to them.

Control the pace

Hold or fire courses and see their current state alongside table activity.

Coordinate the handoff

Track kitchen progress and use the expo view to coordinate readiness across stations.

The service idea: one order can involve several stations without losing the table-level picture.

Split ownership before the bill arrives.

The live demo tracks individual and shared items, allocated tax, paid amounts, and each diner's remaining balance.

EXAMPLE VERIFIED IN THE LIVE DEMO

TABLE 11	ALEX / SEAT 1	SAM / SEAT 2
\$31.12 Total including sample tax Garlic knots: \$8.00 shared Pepperoni pizza: \$20.75 for Alex Subtotal: \$28.75 Sample tax: \$2.37	\$26.79 Pizza: \$20.75 Shared knots: \$4.00 Allocated tax: \$2.04	\$4.33 Individual items: \$0.00 Shared knots: \$4.00 Allocated tax: \$0.33

Pay by diner or settle the remaining table balance. The demo also presents tip presets; the amounts above exclude tips.

Illustrative check, not a receipt. Payments are simulated; no live card processing is demonstrated.

Spot the issue. Understand the pattern.

Manager views surface service exceptions; event-derived analytics connect activity to timing and operational follow-through.

Manage the active shift

Monitor floor health, outstanding requests, and tables needing intervention. A phone layout keeps the same operational focus portable.

Learn from the service trail

Explore timing across greeting, kitchen work, runner delivery, and table turns. Sample metrics illustrate the workflow, not measured customer results.

Change the server. Keep the context.

A shift handoff summarizes active tables and unresolved work, while the event trail records how the session changed.

A structured shift handoff

Review table state, balances, and open requests before transferring responsibility.

A traceable table history

Inspect recorded events for orders, tasks, kitchen progress, and payment activity.

Take a walk through the demo.

SIC Pizza is the demonstration restaurant. The broader platform is designed around configurable restaurant workflows.

SCAN TO OPEN THE DEMO

Demonstration boundaries
The reviewed app uses in-memory session data, a development PIN, and simulated payments. Durable storage, production authentication, payment gateways, hardware integration, and cross-device synchronization need separate implementation or verification before a restaurant rollout.

Sources & scope SIC Pizza project README, domain models, and UI components; supplied screenshots in public/media/sic; live app at pos.yorkstead.com reviewed August 31, 2026. Screenshots show synthetic restaurant data and are selectively framed for readability. Features described are demo capabilities, not a production-readiness certification.
